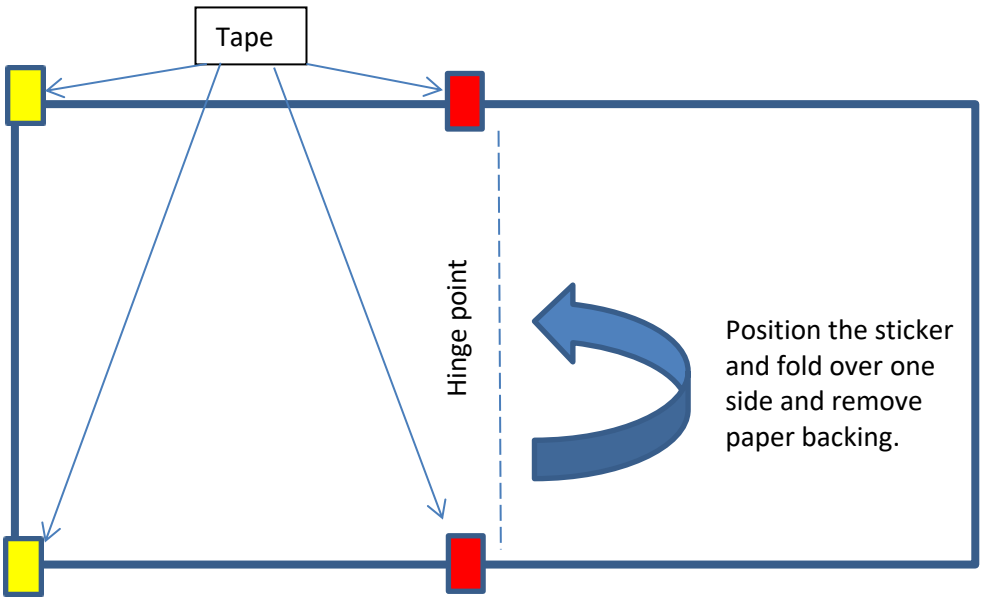
Applying the Sticker
The dacron sticker comes with a white paper backing and a clear plastic carrier.
Ensure that the area where you want to position the sticker is clean and dry.
This need to make sure that the sail is positioned on a flat smooth surface.
Tape the sticker into position using masking tape as shown below

Important: use masking tape to position the sticker in place. Make sure that you use two pieces of masking tape (shown in red) to stick the top and bottom middle sections of the sticker (near the hinge point). Other pieces of masking tape (shown in yellow) can be used to the left of these pieces to help securely position the sticker.



Fold the right hand side of the sticker back over as far as the central two pieces of tape will allow you (so you are effectively folding the sticker in half). Peel off the exposed paper backing from the right side of the sticker to the centre point leaving just the exposed sticker on the clear carrier, and cut away the paper up to the centre point.

Now carefully stick down the exposed right side of the sticker and squeegee into place using a credit card or some flexible squeegee.

Once the right side of the sticker is in place, remove the remaining masking tape and repeat the process with the left side of the sticker.

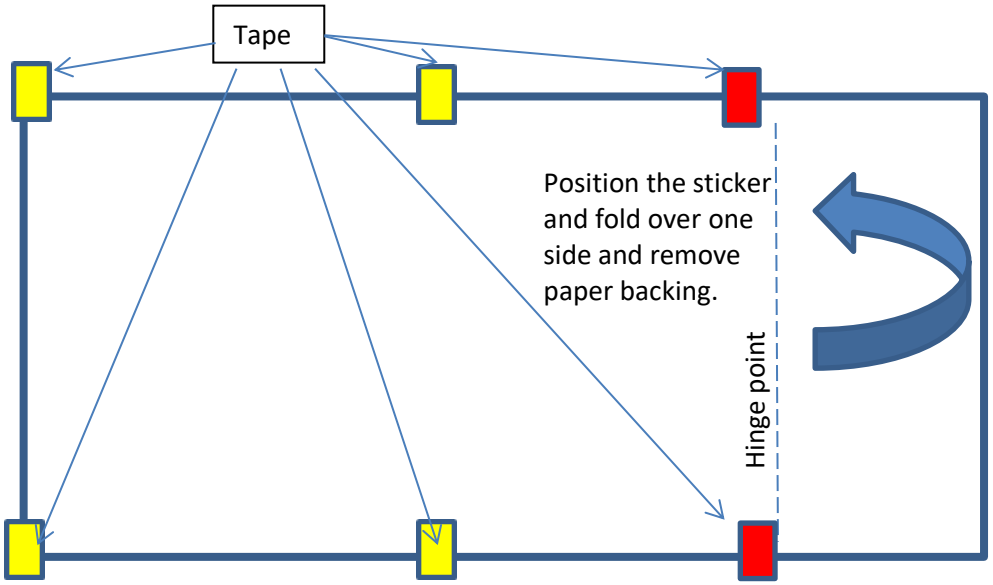
Once stuck in place you can then remove the plastic carrier.

It may help to look up some you tube tutorials on applying decals.

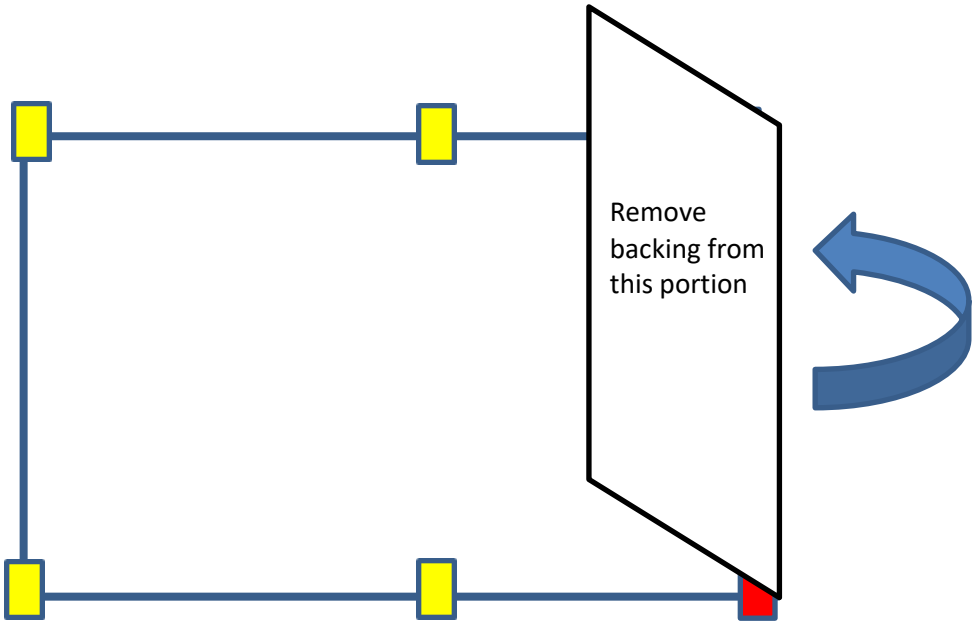
If you make a mistake we always keep a CAD file of your design and can recut any part of the design.

Good Luck!

Applying Larger Stickers
Applying larger stickers uses the same process as described earlier.
The main difference is that you can move the hinge point more to the right of the sticker.

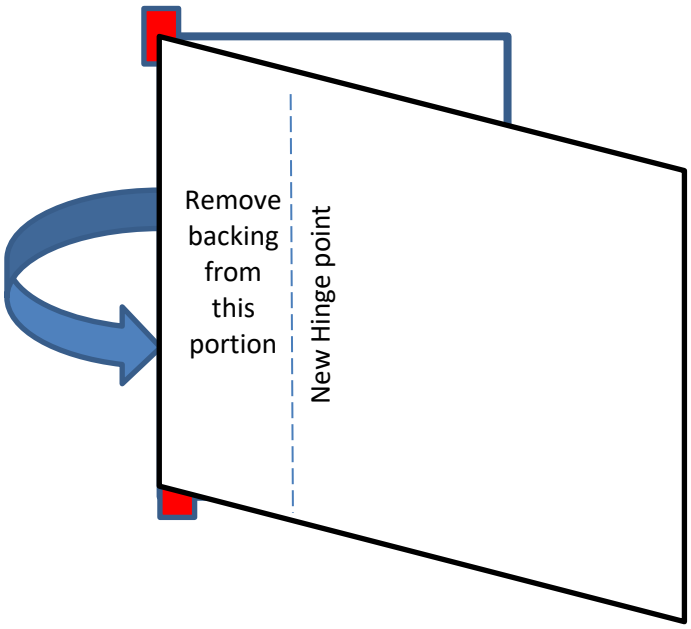


Fold the right hand side of the sticker back over as far as the two pieces of tape (shown in red) will allow you (so in the diagram above about a quarter of the sticker is folded over from the right). Peel off the exposed paper backing from the right side of the sticker to the hinge point leaving the sticker on the clear carrier, and cut away the paper up to the hinge point.

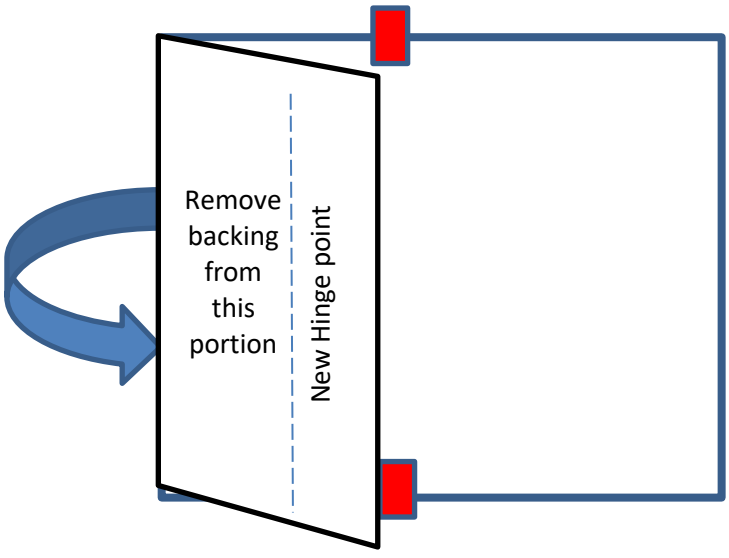


Now carefully stick down the right side of the sticker and squeegee into place using a credit card or some flexible squeegee.

Once the right side of the sticker is in place, fold over the left side of the sticker and remove some more the paper backing from the hinge point to (maybe the half way point of the sticker) and stick that portion down.



Repeat this procedure until the entire sticker has been applied.



For multi coloured stickers, we will supply each colour separately (it's easier to apply this way). Stick down one colour then tape the next colour into position using the first colour as a reference and repeat the process.

It may help to look up some you tube tutorials on applying decals.

Tips

- Make sure you use a flat surface
- Make sure the sail is clean and dry
- Position the sticker and tape into place.
- Take your time
- If you are doing this outside, make sure it's not windy.
- 4 hands are better than 2
- You can carefully reposition components if needed.

If you make a mistake we always keep a CAD file of your design and can recut any part of the design.

Good Luck!
